New Digital Instrument Testing Suite for the Verifit™ is Revolutionary

February 1st, 2008
Dorchester, Ontario

Audioscan® is pleased to introduce **Viewport™**, the first complete testing suite for fitting, counseling, and verifying the function of digital instruments. This new test suite, available only on the Verifit, allows the healthcare professional to verify and demonstrate audibility, directionality, noise reduction, and feedback suppression. Even more impressive, is the fact that all of these tests are integrated and presented on one screen or printout, providing a window to hearing instrument performance.

Four steps that save time and increase the efficiency of any facility.

The **first** step in Viewport is to objectively verify that audibility is delivered using our famous Speechmap® fitting environment. The **second** step is to verify and demonstrate the performance of directional function using our patented directional test. This real time test visually shows the separation of curves between front and rear microphones regardless of advanced processing features like speech activation. The **third** step is to verify and demonstrate the utility of noise reduction, even showing the amount of noise reduction provided! The **fourth** and final step is to show the benefit of feedback reduction systems using the all-new feedback reduction test. This unique feedback test even reveals incipient feedback. All of these results are presented on one screen or printout. You can also store these results internally, to a USB stick, or network file.

Free to Audioscan Owners

This is another free software update for the Verifit, all Audioscan owners receive free software updates for the life of their equipment! Anyone may download the new software featuring Viewport from www.audioscan.com today!
